# GROUND-WATER DATA FOR ORANGE COUNTY AND VICINITY, TEXAS AND LOUISIANA, 1971-74

## INTRODUCTION

### Purpose and Scope

The program of continuing ground-water studies in Orange County and adjacent areas began in March 1967 because of the need for a systematic program to monitor the changing ground-water conditions. The data-collection program, conducted by the U.S. Geological Survey in cooperation with the Texas Water Development Board, the Sabine River Authority of Texas, and the Orange County Commissioner's Court, consists of water-level measurements in observation wells, the collection of water samples from wells for chemical analyses, an inventory of new large-capacity wells, and pumping tests on new large-capacity wells.

This report presents the data collected during the period September 1971 to October 1974 on water-level measurements, chemical analyses of water from wells, and ground-water withdrawals.

The English units used in this report may be converted to metric units by the following conversion factors:

FROM	MULTIPLY BY	TO OBTAIN
feet	0.3048	meters
million gallons per day	3.785	million liters per day

### Well-Numbering System

The well-numbering system in Texas was developed by the Texas Water Development Board for use throughout the State. Under this system, each 1-degree quadrangle is given a number consisting of two digits. These are the first two digits in the well number. Each 1-degree quadrangle is divided into 7½-minute quadrangles which are given two-digit numbers from 01 to 64. These are the third and fourth digits of the well

number. Each 7½-minute quadrangle is divided into 2½-minute quadrangles which are given a single-digit number from 1 to 9. This is the fifth digit of the well number. Finally, each well within a 2½-minute quadrangle is given a two-digit number in the order in which it was inventoried, starting with 01. These are the last two digits of the well number.

Only the last three digits of the well number are shown at each well location (Figure 2); the second two digits are shown in the northwest corner of each 7½-minute quadrangle; and the first two digits are shown by the large block numerals in each 1-degree quadrangle.

In addition to the seven-digit well number, a two-letter prefix is used to identify the county. The prefixes for Orange and adjacent counties are as follows: Orange, UJ; Jasper, PR; Jefferson, PT; Hardin, LH; and Newton, TZ.

Wells inventoried in Louisiana by the Geological Survey are assigned a number consisting of two parts, an abbreviation of the name of the parish in which the well is located and a serial number that designates the well. The number assigned does not indicate a specific location because the number is generally assigned in the order in which the well was inventoried. The prefix for Calcasieu Parish is CU; the prefix for Cameron Parish is CN.

## GROUND-WATER DATA

### Water-Level Measurements

A network of 116 observation wells was maintained for water-level measurements from 1971 to 1974. The area within the network includes Orange County, the southern parts of Jasper and Newton Counties, the eastern part of Jefferson County, the southeastern part of Hardin County, all in Texas; and the western parts of Cameron and Calcasieu Parishes, Louisiana. The heaviest concentration of observation

the first of these is the fact that the  
the second is the fact that the  
the third is the fact that the  
the fourth is the fact that the  
the fifth is the fact that the

the forty-seventh is the fact that the  
the forty-eighth is the fact that the  
the forty-ninth is the fact that the  
the fiftieth is the fact that the  
the fifty-first is the fact that the  
the fifty-second is the fact that the  
the fifty-third is the fact that the  
the fifty-fourth is the fact that the  
the fifty-fifth is the fact that the  
the fifty-sixth is the fact that the  
the fifty-seventh is the fact that the  
the fifty-eighth is the fact that the  
the fifty-ninth is the fact that the  
the sixtieth is the fact that the  
the sixty-first is the fact that the  
the sixty-second is the fact that the  
the sixty-third is the fact that the  
the sixty-fourth is the fact that the  
the sixty-fifth is the fact that the  
the sixty-sixth is the fact that the  
the sixty-seventh is the fact that the  
the sixty-eighth is the fact that the  
the sixty-ninth is the fact that the  
the seventieth is the fact that the  
the seventy-first is the fact that the  
the seventy-second is the fact that the  
the seventy-third is the fact that the  
the seventy-fourth is the fact that the  
the seventy-fifth is the fact that the  
the seventy-sixth is the fact that the  
the seventy-seventh is the fact that the  
the seventy-eighth is the fact that the  
the seventy-ninth is the fact that the  
the eightieth is the fact that the  
the eighty-first is the fact that the  
the eighty-second is the fact that the  
the eighty-third is the fact that the  
the eighty-fourth is the fact that the  
the eighty-fifth is the fact that the  
the eighty-sixth is the fact that the  
the eighty-seventh is the fact that the  
the eighty-eighth is the fact that the  
the eighty-ninth is the fact that the  
the ninetieth is the fact that the  
the ninety-first is the fact that the  
the ninety-second is the fact that the  
the ninety-third is the fact that the  
the ninety-fourth is the fact that the  
the ninety-fifth is the fact that the  
the ninety-sixth is the fact that the  
the ninety-seventh is the fact that the  
the ninety-eighth is the fact that the  
the ninety-ninth is the fact that the  
the hundredth is the fact that the

wells is within the industrial area in the southern part of Orange County. The locations of water-level observation wells are shown on Figure 2.

Static water-level measurements were made generally in the early part of the year at the time of least interference from pumping and maximum recovery from the previous heavy seasonal pumping. Pumping water-level measurements were made during the latter part of the year at the time of maximum drawdown of water levels. These data are needed to study the relationships between water levels and withdrawals at the time of maximum effects. In addition to the periodically measured wells, one well has been selected for continuous monitoring of water levels. All static and pumping water-level measurements and selected measurements from the continuous monitor are given in Table 2. Hydrographs of two wells with the longest periods of record are shown on Figure 1.

## **Chemical Analyses of Water From Wells**

A network of 76 wells to observe changes in chemical quality of the ground water was maintained from 1971 to 1974 in Orange County. Water samples were obtained from most of these wells during the latter part of each year. During these periods, the maximum concentrations of chlorides are expected.

Locations of the chemical-quality observation wells are shown on Figure 3. The results of chemical analyses are given in Table 3.

## **Ground-Water Withdrawals**

Data on ground-water pumpage for all major uses during the period 1963-74 are given in Table 1. These data are essential to any study of the cause and effect relationships between pumping and the decline in water levels or changes in chemical quality.
